

Bethereum Smart Contract Auditing Certification

This certificate is issued to certify that we have tested and audited the smart contract that governs:

- Token Creation
- Token Distribution

Of Bethereum project located in website <https://bethereum.com> and its git repository located in publicly accessible GitHub destination: <https://github.com/bethereumproject/token-sale>.

We have audited the contract to ensure that it has the behaviour explained in the GitHub readme file with the latest change in the commit code `fa409780b81bf09619d0742fa43e67a8786e2ac6`.

We have performed 31 case studies that involve testing each public facing function logic presented in the AIO.sol file in the repository. Our results were forwarded and the issues were mitigated by the team. The current version of the contract has complete coverage over all test cases we have generated and they all have resulted positively.

Test were performed on the following environments:

- Remix virtual machine
- Ropsten testnet
- Rinkeby testnet
- Private Ethereum fork

The results were positive and test cases were positively passed. The contract should to the best of our knowledge uphold the logic described in the readme document.
